Ulam-Hyers Stability Results for Fixed Point Problems via Generalized Multivalued Almost Contraction

Supak Phiangsungnoen and Poom Kumam, Member, IAENG.

Abstract—In this paper, we introduced the notion of a generalized multivalued \((\alpha, \psi)\)-almost contractions and establish the existence of fixed point theorems for this class of mapping. The results presented in this paper generalize and extend some recent results in multivalued almost contraction. Also, we show its applications in the Ulam-Hyers stability of fixed point problems for multivalued operators.

Index Terms—Almost contraction, Fixed point theorems, Generalized multivalued almost contraction, Ulam-Hyers stability.

I. INTRODUCTION

A study of fixed point for a multivalued (set-valued) mappings was originally initiated by von Neumann [23] in the study of game theory. The development of geometric fixed point theory for multivalued mapping was initiated with the work of Nadler [16] in 1969. He combined the ideas of multivalued mapping and Lipschitz mapping and used the concept of Hausdorff metric to establish the multivalued contraction principle, usually referred as Nadler’s contraction mapping principle.

Definition 1. [16] Let \((X, d)\) be a complete metric space and \(S : X \rightarrow CB(X)\) be multivalued mapping such that for all \(x, y \in X\), we have

\[
H(Sx, Sy) \leq kd(x, y), \quad \text{where} \quad k \in (0, 1).
\] (1)

Then there exists \(z \in X\) such that \(z \in Sx\).

In 2003, Berinde [3] introduced almost contractions that satisfy a simple but general contraction condition which includes most of the conditions in Rhoades classification [18]. He obtained a fixed point theorem for such mappings which generalized the results of Kannan [13]. The weakly contractive metric-type fixed point result in [4] is almost covered by the related altering metric one due to Khan et al.[13]. A number of papers appeared in which fixed points of almost contractions for single valued mapping have been discussed (see [1, 4-7, 20] and references therein).

In 2007, M. Berinde and V. Berinde [2] extended almost contractions of self-mappings to the case of multivalued almost contractions. Afterward, several researches have extended and proved the fixed point theorems of multivalued almost contractions (see [5–7] and references therein).

On the other hand, stability problem of functional analysis is another one which play the most important in mathematics analysis. It was introduced by Ulam [22], he was concerned with the stability of group homomorphisms. Afterward, Hyers [12] gave a first affirmative partial answer to the question of Ulam for Banach spaces, this type of stability is called Ulam-Hyers stability. Several authors consider Ulam-Hyers stability results in fixed point theory and remarkable result on the stability of certain classes of functional equations via fixed point approach (see [8–11, 15, 21] and references therein).

In this work, we give fixed point results for some new class of multivalued almost contractions. Our results generalize and extend several multivalued almost contraction results in the existing literature. Moreover, we show its applications in the Ulam-Hyers stability of fixed point problems for multivalued operators.

II. PRELIMINARIES

Throughout this paper, let \((X, d)\) be a metric space and \(CB(X)\) be the family of nonempty closed bounded subsets of \(X\). For a point \(x\) in \(X\) and a nonempty subset \(A\) of \(X\), we define the distance \(d(x, A)\) from \(x\) to \(A\) by

\[
d(x, A) = \inf \{d(x, a) : a \in A\},
\]

\[
d(A, B) = \inf \{d(a, b) : a \in A, b \in B\}.
\]

For \(A, B \in CB(X)\), we define the Hausdorff distance, between \(A\) and \(B\) by

\[
H(A, B) = \max \left\{ \sup_{a \in A} d(a, B), \sup_{b \in B} d(b, A) \right\},
\] (2)

which is symmetric in \(A\) and \(B\). It well known that \((CB(X), H)\) is a complete metric space.

Definition 2. Let \(S : X \rightarrow (CB(X))\) be a multivalued mapping. An element \(x \in X\) is said to be a fixed point of \(S\) if \(x \in Sx\).

Lemma 3 ([16]). Let \((X, d)\) be a metric space and \(A, B \in CB(X)\), then for each \(a \in A\),

\[
d(a, B) \leq H(A, B).
\]

Lemma 4 ([16]). Let \((X, d)\) be a metric space and \(A, B \in CB(X)\), then for each \(a \in A, \varepsilon > 0\), there exists an element \(b \in B\) such that \(d(a, b) \leq H(A, B) + \varepsilon\).

Lemma 5. Let \((X, d)\) be a metric space. Let \(A, B \in X\) and \(q > 1\). Then, for every \(a \in A\), there exists \(b \in B\) such that

\[
d(a, b) \leq qH(A, B).
\] (3)

Proof. If \(H(A, B) = 0\), then \(a \in B\) and (3) holds for \(b = a\). If \(H(A, B) > 0\), then let us denote

\[
\varepsilon = (q - 1)H(A, B) > 0.
\] (4)
Again by (6), we have
\[
\min\{d(x, Sx), d(y, Sy), d(x, Sy), d(y, Sx)\} \geq \min\{d(x, y), \varphi(d(x, y))\},
\]
for all \(x, y \in X\). Then \(S\) has a fixed point in \(X\).

Proof. Let \(q > 1\). Let \(x_0 \in X\) and \(x_1 \in Sx_0\). If \(H(Sx_0, Sx_1) = 0\) then \(Sx_0 = Sx_1\), i.e., \(x_1 \in Sx_1\), then \(x_1\) is fixed point of \(S\). Let \(H(Sx_0, Sx_1) \neq 0\). By Lemma 5, there exists \(x_2 \in Sx_1\) such that
\[
d(x_1, x_2) \leq qH(Sx_0, Sx_1).
\]
By (6), we obtain
\[
d(x_1, x_2) \leq q\alpha(d(x_0, x_1))d(x_0, x_1) + \varphi(d(x_0, x_1))
\]
\[
\min\{d(x_0, Sx_0), d(x_1, Sx_1), d(x_0, Sx_1), d(x_1, Sx_0)\}
\]
\[
\leq q\alpha(d(x_0, x_1))d(x_0, x_1) + \varphi(d(x_0, x_1))
\]
\[
\min\{d(x_0, x_1), d(x_1, x_2), d(x_0, x_2), d(x_1, x_1)\}
\]
\[
\leq q\alpha(d(x_0, x_1))d(x_0, x_1).
\]
Because
\[
\min\{d(x_0, Sx_0), d(x_1, Sx_1), d(x_0, Sx_1), d(x_1, Sx_0)\} = 0
\]
and we take \(\theta = q\alpha(d(x_0, x_1))\), hence
\[
d(x_1, x_2) \leq \theta d(x_0, x_1).
\]
If \(H(Sx_1, Sx_2) = 0\) then \(Sx_1 = Sx_2\), i.e., \(x_2 \in Sx_2\), then \(x_2\) is fixed point of \(S\). Let \(H(Sx_1, Sx_2) \neq 0\). By Lemma 5, there exists \(x_3 \in Sx_2\) such that
\[
d(x_2, x_3) \leq qH(Sx_1, Sx_2).
\]
Again by (6), we have
\[
d(x_2, x_3) \leq q\alpha(d(x_1, x_2))d(x_1, x_2) + \varphi(d(x_1, x_2))
\]
\[
\min\{d(x_1, Sx_1), d(x_2, Sx_2), d(x_1, Sx_2), d(x_2, Sx_1)\}
\]
\[
\leq q\alpha(d(x_1, x_2))d(x_1, x_2) + \varphi(d(x_1, x_2))
\]
\[
\min\{d(x_1, x_2), d(x_2, x_3), d(x_1, x_3), d(x_2, x_2)\}
\]
\[
\leq q\alpha(d(x_1, x_2))d(x_1, x_2).
\]
Because
\[
\min\{d(x_1, Sx_1), d(x_2, Sx_2), d(x_1, Sx_2), d(x_2, Sx_1)\} = 0
\]
and \(\theta = q\alpha(d(x_1, x_2))\), So, we have
\[
d(x_2, x_3) \leq \theta d(x_1, x_2) \leq \theta^2 d(x_0, x_1).
\]
By continuing this process, we obtain a sequence \(\{x_n\}\) in \(X\) such that \(x_n \in X, x_n \neq x_{n-1}\) and
\[
d(x_n, x_{n+1}) \leq \theta d(x_{n-1}, x_n)
\]
for all \(n \in \N\). By inductive, we obtain
\[
d(x_n, x_{n+1}) \leq \theta^n d(x_0, x_1).
\]
Hence,
\[
d(x_{n+k}, x_{n+k+1}) \leq \theta^{k+1} d(x_{n-1}, x_n)
\]
for all \(n, k \in \N\). Now, for positive integers \(m\) and \(n\) with \(m > n\), we have
\[
d(x_n, x_m) \leq d(x_n, x_{n+1}) + d(x_{n+1}, x_{n+2}) + \ldots + d(x_{m-1}, x_m)
\]
\[
\leq \theta^n d(x_0, x_1) + \theta^{n+1} d(x_0, x_1) + \ldots + \theta^{m-1} d(x_0, x_1)
\]
\[
\leq \theta^m (1 - \theta^{m-1}) d(x_0, x_1).
\]
Since, \(\theta < 1\), we get \(d(x_n, x_m) \to 0\) as \(n \to \infty\). Therefore, \(\{x_n\}\) is a Cauchy sequence in \(X\). Now, from the completeness of \(X\), there exists \(x^* \in X\) such that \(x_n \to x^*\) as \(n \to \infty\). Then
\[
d(x^*, Sx^*) \leq d(x^*, x_{n+1}) + d(x_{n+1}, Sx^*)
\]
\[
\leq d(x^*, x_{n+1}) + H(Sx_n, Sx^*)
\]
\[
\leq d(x^*, x_{n+1}) + \alpha d(x_n, x^*)d(x_n, x^*) + \varphi(d(x_n, x^*))
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq d(x^*, x_{n+1}) + \alpha d(x_n, x^*)d(x_n, x^*) + \varphi(d(x_n, x^*))
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq d(x^*, Sx^*) \leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
\[
\min\{d(x_n, Sx_n), d(x^*, Sx^*), d(x_n, Sx^*), d(x^*, Sx_n)\}
\]
\[
\leq \delta d(x_n, x^*) + L d(x_n, Sx^*)
\]
for all $x, y \in A$. Then $S$ has a fixed point in $X$.

IV. THE ULAM-HYERS STABILITY

We start this section by presenting the Ulam-Hyers stability concepts for the fixed point problem associated to a multivalued operator.

**Definition 9.** Let $(X, d)$ be a complete metric space and $S : X \rightarrow CB(X)$ be an operator. By definition, the fixed point inclusion

$$x \in Sx$$

for all $x \in X$ and for each $\varepsilon > 0$ real number the following inequality

$$d(y, Sy) \leq \varepsilon,$$

is said to be generalized Ulam-Hyers stable if there exists an increasing operator $\psi : [0, \infty) \rightarrow [0, \infty)$, continuous at $0$ and $\psi(0) = 0$ such that for each $\varepsilon > 0$ real number and each solution $y^* \in X$ an solution of the inequality (10) there exists a solution $x^* \in X$ of the fixed point inclusion (9) such that

$$d(y^*, x^*) \leq \psi(\varepsilon).$$

If there exists $c > 0$ such that $\psi(t) := ct$, for each $t \in [0, \infty)$, then the fixed point inclusion (9) is said to be Ulam-Hyers stable.

Now, we prove a generalized Ulam-Hyers stability for fixed point problems which Theorem 6 hold.

**Theorem 10.** Let $(X, d)$ be a complete metric space. Suppose that all the hypotheses of Theorem 6 hold and also that the function $\psi : [0, \infty) \rightarrow [0, \infty)$ defined by $\psi(t) := t - t\alpha(t)$ is strictly increasing and onto. Then, the fixed point inclusion (9) is generalized Ulam-Hyers stable.

**Proof.** By Theorem 6, we have $x^* \in Sx^*$, that is, $x^* \in X$ is a solution of the fixed point inclusion (9). Let $\varepsilon > 0$ and $y^* \in Sy^*$ is a solution of the inequality (10), that is

$$d(y^*, Sy^*) \leq \varepsilon.$$

Now, we obtain

$$d(x^*, y^*) = d(Sx^*, y^*)$$

$$\leq d(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq d(x^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq H(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq [\alpha d(x^*, y^*)] \langle d(x^*, y^*) \rangle + \varphi(d(x^*, y^*))$$

$$\min \{d(x^*, Sx^*), d(y^*, Sy^*), d(x^*, Sy^*), d(y^*, Sx^*)\} \leq \alpha d(x^*, y^*) + \varepsilon.$$

It follows that

$$d(x^*, y^*) - \alpha d(x^*, y^*)d(x^*, y^*) \leq \varepsilon.$$

Since $\psi(t) := t - t\alpha(t)$, we have

$$\psi(d(x^*, y^*)) := (d(x^*, y^*) - \alpha d(x^*, y^*))d(x^*, y^*).$$

It implies that

$$d(x^*, y^*) \leq \psi^{-1}(\varepsilon).$$

Notice that $\psi^{-1} : [0, \infty) \rightarrow [0, \infty)$ exists, is increasing, continuous at $0$ and $\psi^{-1}(0) = 0$. Therefore, the fixed point inclusion (9) is generalized Ulam-Hyers stable. This completes the proof.

**Corollary 11.** Let $(X, d)$ be a complete metric space. Suppose that all the hypotheses of Corollary 7 hold. Then the fixed point inclusion (9) is Ulam-Hyers stable.

**Proof.** By Corollary 7, we have $x^* \in Sx^*$, that is, $x^* \in X$ is a solution of the fixed point inclusion (9). Let $\varepsilon > 0$ and $y^* \in Sy^*$ is a solution of the inequality (10), that is

$$d(y^*, Sy^*) \leq \varepsilon.$$

Now, we obtain

$$d(x^*, y^*) = d(Sx^*, y^*)$$

$$\leq d(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq d(x^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq H(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq [\delta d(x^*, y^*) + L \min \{d(x^*, Sx^*), d(y^*, Sy^*), d(x^*, Sy^*), d(y^*, Sx^*)\}] + \varepsilon$$

$$\leq \delta d(x^*, y^*) + \varepsilon.$$

It follows that

$$d(x^*, y^*) - \delta d(x^*, y^*) \leq \varepsilon.$$

Since $\delta \in (0, 1)$, we have

$$d(x^*, y^*) \leq \frac{1}{1 - \delta} \varepsilon.$$

Because $\frac{1}{1 - \delta} > 0$. Therefore, the fixed point inclusion (9) is generalized Ulam-Hyers stable. This completes the proof.

**Remark 12.** If suppose that all the hypotheses of Corollary 9 holds. Also, the fixed point inclusion (9) is Ulam-Hyers stable.

**Corollary 13.** Let $(X, d)$ be a complete metric space. Suppose that all the hypotheses of Corollary 8 hold. Then, the fixed point inclusion (9) is generalized Ulam-Hyers stable.

**Proof.** By Corollary 8, we have $x^* \in Sx^*$, that is, $x^* \in X$ is a solution of the fixed point inclusion (9). Let $\varepsilon > 0$ and $y^* \in Sy^*$ is a solution of the inequality (10), that is

$$d(y^*, Sy^*) \leq \varepsilon.$$

Now, we obtain

$$d(x^*, y^*) = d(Sx^*, y^*)$$

$$\leq d(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq d(x^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq H(Sx^*, Sy^*) + d(Sy^*, y^*)$$

$$\leq [\delta d(x^*, y^*) + L \min \{d(x^*, Sx^*), d(y^*, Sy^*), d(x^*, Sy^*), d(y^*, Sx^*)\}] + \varepsilon$$

$$\leq (\delta + L) d(x^*, y^*) + \varepsilon.$$

It follows that

$$d(x^*, y^*) - (\delta + L) d(x^*, y^*) \leq \varepsilon.$$

Since $\delta \in (0, 1)$ and for some $L \geq 0$, we have

$$d(x^*, y^*) \leq \frac{1}{1 - \delta - L} \varepsilon.$$

Therefore, the fixed point inclusion (9) is generalized Ulam-Hyers stable. This completes the proof.
